Dalian Institute of Technology, Dalian, China

Keywords: academic ethics; pursuit of truth; innovative thinking; rigorous study; honest and trustworthy

Abstract: Through in-depth analysis of “Several Opinions on Strengthening Academic Morality Construction”, the Ministry of Education attaches great importance to the construction of academic ethics. In the process of academic research, researchers need to adhere to the basic principles of academic ethics, and must study rigorously and be honest and trustworthy. Conduct academic research under the guidance of principles. Academic fraud and other phenomena seriously affect the level of development in the academic world. Researchers should conduct in-depth exploration and cognition of the basic connotations and requirements of academic ethics, better conduct academic research, and purify the academic research environment.

1. Introduction

Morality is mainly an ideology that reflects and adjusts various relationships in real life. The evaluation of morality needs to be based on the inner beliefs and social paradoxes that people present. This is also the current practice of people in different industries. Create guidelines for mutual respect, especially in the field of academic research. The basic connotation of academic ethics includes pursuing truth, seeking truth from facts, being brave in innovation, and studying hard, providing behavioral norms for current academic research, guiding researchers to correct their own research attitudes and academic research value cognition, so as to better conduct academic research. . Academic ethics is the principle that researchers must follow to conduct academic research and study. Among them, honesty is the core content of academic ethics. Whether it is cheating in exams or plagiarism in the process of writing papers is a violation of academic ethics. Therefore, in the process of academic research, people need to constrain their own academic research behaviors, rely on conscience and social public opinion to maintain academic ethics and purify the academic research environment.

2. Academic ethics requires academic personnel to pursue truth and develop a research spirit of seeking truth from facts

Seeking truth from facts means that people must pursue the truth, conduct academic analysis on the basis of upholding the truth, and better carry out academic research and fruitful thinking. Through the analysis of the relevant academic research content, we can know that academic ethics requires academic researchers to pursue the truth and develop a research spirit of seeking truth from facts. In the process of conducting academic research, people should pay attention to the pursuit of truth, better study and think in knowledge learning, and thus continue to accumulate knowledge [1]. Learning is not a simple form of practical activity, a process of exploring and discovering unknown knowledge, and a process of understanding and recognizing objective laws to explore the truth. Because objective laws do not shift because of people's willpower, researchers should adhere to the principles of academic research that seeks truth from facts, attach importance to the exploration of various materials and combine their own academic innovations to conduct research and obtain truth knowledge through their own efforts.

Seeking truth from facts is an academic ethic that people need to abide by. Pursuing the truth is also a basic requirement for conducting academic research. It is necessary to adhere to these basic principles in academic research in order to obtain better research results. Researchers need to look

at the objective objects correctly, and they can gain real subject knowledge through hard work analysis and point of view exploration. In the process of conducting academic research, researchers need to repeatedly understand and think about scientific laws and principles, and should also demonstrate academic views based on experimental comparisons. Scientific knowledge is not allowed to add false information, and it is not possible to publish results by deceiving others. Instead, it should adhere to the principle of seeking truth from facts, so as to better carry out academic research.

3. Academic ethics requires researchers to be innovative and form a good spiritual outlook

People need to adhere to a variety of basic requirements in the process of academic research, so that they can conduct academic research better and strive to obtain better research results. The academic spirit contains many elements. Being brave in innovation is a relatively good research spirit. It requires researchers to dare to break through the limitations of previous academic research and obtain better academic research results. The spirit of innovation requires researchers to actively break through the previous ideological constraints, explore and deepen the scientific truth, and thus gain more academic research results [2]. Therefore, academic ethics requires researchers to explore new ways, form a good spiritual outlook, and conduct in-depth academic research. When people carry out academic research, they should establish research consciousness and concepts that are brave in innovation, actively break through the previous stereotypes, and cannot be bound by old research concepts, and reasonably expand their academic research viewpoints. Learning is the process of accumulating knowledge, but the ultimate goal is to solve life problems flexibly through knowledge. It is not simply accumulating knowledge. Science and technology are the main driving force for the development of today's society. In such a development environment, it is necessary to adhere to the sense of innovation in order to achieve better development of the times. But innovation does not abandon the previous research results, it needs inheritance, and achieves better academic development and research on the basis of inheritance. Therefore, when conducting academic research, we should establish a sense of innovation, conduct academic research on the basis of practical study and research and exploration, and form a better spiritual outlook.

The courage to explore and inherit innovation as the moral requirements of academic research, researchers need to establish the awareness of active exploration and deep learning, and continue to learn knowledge in the process of knowledge learning and academic research, used to climb the peak of academic research. Marx proposed that there is no flat road on the road of scientific research, but that it should climb steep mountains and finally harvest brilliant results. Therefore, in the process of conducting academic research, it is necessary to actively explore knowledge points and explore scientific and cultural knowledge through various channels to provide better preparation for innovation. If there is not enough preparation for innovation, academic innovation cannot be carried out, and various tasks of knowledge reserve are needed [3]. To this end, academic staff need to abide by the academic ethical requirements of innovation, and form a better mental outlook through the way of acquiring knowledge. It is not the practice advocated by academic ethics. All academic researchers should pay attention to the accumulation and thinking of knowledge, and gain better research results through innovative exploration. Only in this way can we achieve the innovative preparation of academic research, and exert our own exploration interests on the basis of summarizing the research results in the field, and better carry out academic research.

4. Researchers should study hard and study academically with a rigorous academic attitude

The industry is skilled in diligence and diligence, and diligence and knowledge is the main basis for people's success in their careers, and it is also the main guarantee for scholars to achieve academic success. In the process of studying, people should not only actively increase the amount of knowledge, but also achieve breakthroughs in quality through innovative learning to build a relatively solid knowledge system. Therefore, researchers should study hard and actively publish academic opinions under the guidance of rigorous scholarship. When conducting academic research,

people need to actively learn from various subject knowledge and transform into their own knowledge structure. They also need to explore and analyze results in other fields. The ocean of knowledge is vast and innocent, and people should actively carry forward the spirit of struggle and seek to realize the search for truth through continuous exploration [4]. In knowledge learning and academic research, we will encounter various problems. Only by actively exerting the spirit of perseverance in academic research can we acquire the knowledge of truth and actively publish academic opinions.

Diligent study is an academic ethic that researchers must abide by. Students should maintain a learning attitude and study the theoretical knowledge in order to obtain better research results. People need to take every aspect of learning seriously. Whether it is to carry out the study of textbook knowledge or to publish academic opinions, we should strictly abide by the principle of “rigorousness” - no foolish behavior, nor perfunctory academic research behavior. Academic ethics is the basic requirement of current academic work, and it is also the conscience of scholars in the process of academic research. Under such requirements, people must establish a sense of observing academic ethics, and thus participate in academic research and theoretical exchange with a better attitude. . Academic research is not a simple process of learning and research. Before conducting academic research, academics need to do all kinds of preparatory work, attach importance to content summarization and opinion analysis of relevant academic research materials, and carry out innovative exploration in combination with their own academic thinking direction. Good academic exploration. Academic insights are not the reproduction of previous research results or the adaptation of opinions. Instead, they carry out innovative explorations based on their own knowledge accumulation and academic thinking, attach importance to presenting their own academic research perspectives, and fill in the gaps in previous academic research. This reflects the value of better academic research.

5. Academic ethics requires learners to respect the academic research results of others and prevent academic fraud and other behaviors

Academic ethics is the basic requirement of current academic work. It is also the conscience of scholars in the process of academic research. The implementation and specific maintenance need to rely on scholars and social public opinion constraints. In the process of conducting academic research, researchers need to adhere to the principle of honesty and trustworthiness, actively organize relevant academic research materials and explore opinions, attach importance to exerting their own initiative to obtain better research results, and strengthen the overall research ethics of the academic community. This is because academic ethics is the principle that people should abide by in academic research and study. Honesty is the core content of academic ethics. Whether it is cheating in exams or plagiarism in the process of writing papers is a violation of academic ethics. These behaviors have an impact on the quality of the research results of researchers. If researchers fail to respect the academic research results of others and plagiarize the published academic research results, this will not only infringe the legitimate rights and interests of the original author, but also easily lead to academic research. Disputes will have a negative impact on the academic atmosphere of the academic community. Academic ethics requires learners to respect the academic research results of others and prevent academic fraud. Therefore, in the process of conducting academic research, it is necessary to adhere to academic ethics and strictly abide by the requirements of academic ethics, so as to carry out higher level academic inquiry [5]. People need to carry out academic thinking and research under the guidance of academic ethics, and carry out academic research on the basis of adhering to various basic requirements, thus ensuring the rationality and innovation of academic research.

In the process of academic thinking, researchers need to repeatedly understand and think about scientific laws and principles, and should also demonstrate academic views based on experimental comparisons. In this way, we can implement more accurate academic research and publish more academic insights by exerting its own value. Because scientific knowledge is not allowed to add false information, it is not possible to publish results by deceiving others. Instead, it should adhere

to the principle of seeking truth from facts, so as to better carry out academic research. Therefore, under the guidance of honest and trustworthy academic ethics, researchers need to respect the research results of other scholars, and can not appear bad behaviors of academic fraud. Academic fraud will not only have a serious negative impact on the academic atmosphere, but also infringe on the legitimate rights and interests of others, thus causing multiple constraints on academic research. Academic research pays more attention to proposing new ideas and achievements, and provides more research opinions or results reference through academic research methods to fill relevant gaps. This will enhance the research level in a certain field, provide more academic support for the calligraphy exhibition, and obtain better academic research value.

6. Conclusion

Pursuing the truth, seeking truth from facts, and being brave in innovation are the basic requirements of current academic ethics. People should conduct various research under the guidance of academic ethics and publish more academic research results. At the same time, academic ethics provides behavioral norms for current academic research, guiding researchers to correct their own research attitudes and academic research value cognition, so as to better conduct academic research. Academic personnel need to correct their own attitudes towards academic research, strictly abide by various academic ethical requirements, and better exert their initiative to gain better academic research results. This paper believes that academic ethics requires academic personnel to pursue the truth, and requires researchers to be brave in innovation and form a good spiritual outlook. At the same time, researchers should diligently study under the guidance of rigorous scholarship and actively publish academic opinions, thus enhancing the ultimate value of academic research. In addition, academic ethics requires learners to respect the academic research results of others and prevent academic fraud.
