Keywords: Rural Revitalization, Strategic Model, Industrial Integration, Six Industrial Development, Impact Analysis

Abstract: Revitalizing China is definitely not an empty word, it should be based on its own national conditions, find its own outstanding short board, and concentrate its efforts to fill the corresponding short board, so that the country faces great progress and development. China's short board in the countryside, only to make the countryside face real development, progress and rise, China's revival is imminent, China's progress is confident. Since the 19th National Congress, the strategy of rural revitalization has been formally put forward for the first time, which is worth pondering. Agriculture and rural areas should be prioritized for development. In the process of revitalizing the countryside, we should uphold the thinking of industrial integration and put the rural revitalization into practice.

1. Analysis of Problems in the Current Strategy of Rural Revitalization

If China is to move forward better and become a better country, it should have a deeper understanding and understanding of China. Only in this way will China's tomorrow shine brightly. China's most prominent short board comes from the countryside, if China's countryside has made great progress and progress, China will usher in the most moving dawn. As General Secretary Xi said: whether a well-off society, the key depends on the townspeople. How to revitalize the countryside and how to increase farmers' income is a major problem. In the process of rural revitalization, we should use the strategic thinking of industrial integration to carry out the mode of six industrial development.

1.1. Lack of a Clear Programme of Action For Farmers

The desire to increase production and income is the intrinsic wish of every farmer, but for farmers, how to achieve their wishes through concrete efforts is a question worth pondering. For farmers, can not find a specific, reliable path to complete the corresponding income increase, which is a problem that farmers feel more painful. Many farmers do not have a deep understanding of the times, therefore, can not keep pace with the times, pioneering innovation, this is a universal problem for farmers, farmers' dream of wealth can not be realized on the stage of reality, this is not related to whether farmers are industrious and able, the most important question is: farmers did not find the right way, nor did they support their own program of action. As table 1 analyses, most farmers don't know much about how to make a fortune, and many do n' t find a way forward[1].

Table 1 Relevant questionnaires

Does the farmer know how to realize his dream of making a fortune	
Never know	98.17%
Clear understanding	1.83%

1.2. The Integration of Rural Industries Has Not Been Fully Implemented

Industrial integration is an important strategic idea for rural revitalization. The correct strategic thought can push all the people into the road of prosperity, but the premise is that the people need to have a deep understanding and understanding of the strategic thought, if the people have a deviation

in understanding the major strategic thought, then the strategy of rural revitalization is difficult to be fully implemented. As the analysis in Table 2, there are deviations and fallacies in many farmers' understanding of industrial integration, and these ideological deviations and fallacies lead to many good opinions can not be carried out. This is undoubtedly a matter of regret.

Table 2 Relevant questionnaires

Have a deep understanding and understanding of industrial integration	
Yes	7.89%
No	92.11%

1.3. Farmers' Understanding of Six Industrial Developments is not Deep Enough

There are three major industries said, agriculture, industry, service industry. In a developed country, the proportion of service industry is greater than that of industry, in other words, the tertiary industry is greater than that of secondary industry. But for a developing country, the secondary industry is larger than the tertiary industry is larger than the primary industry. The theory of six industrial development was born in document No .1 of 2015. In this document, the Central Committee clearly put forward that to complete the work of "one after another ", farmers should combine the primary industry, the secondary industry and the tertiary industry, which can not only complete the crop planting work of the primary industry, but also complete the crop processing work of the secondary industry, and also complete the circulation, sale and processing of products in the tertiary industry. In theory, if farmers can complete a good industrial integration, the implementation of the six industrial development model into practice, will certainly reap good results, but from the practical operational level analysis, many farmers' practical ability can not be competent for such a heavy work.[2]They can only do well in the cultivation of agricultural products in the primary industry, and at the same time, they can do well in the processing of agricultural products in a state of reluctance, but they are not competent for the marketing and service of agricultural products. As shown in table 3, the vast majority of farmers find it difficult to work in the tertiary industry.

Table 3 Relevant questionnaires

The development of that industry in the six industrial developments makes farmers feel more difficult?	
Primary industry	0.58%
Secondary	21.29%
Tertiary sector	78.13%

2. How Should Farmers Complete The Strategy of Rural Revitalization and Realize the Development of Six Industries

2.1. Self-Conscious Development Trend Towards the Times

Any individual who has achieved outstanding achievements is a person who closely follows the trend of the times. If he moves in accordance with the times, he will certainly achieve extraordinary achievements, but if he becomes the retrograde of the times, he will be abandoned by the current of the times. Farmers should understand the current trend of historical development, only to understand the trend and trend of development of the times, can actively change themselves and achieve a career. The great rejuvenation of the Chinese nation is the trend of development, the rural revitalization is the trend of development, and the industrial integration is also the trend of development. If farmers take the ride of the times, they can certainly become the first rich people, if indifferent in the face of the development of the times, will inevitably be abandoned by the times, because the times never wait for anyone to enjoy their success, easy and laborious people, cautious people, the times welcome people are the tide, they do not fear the wind and rain, face the difficulties, face the opportunities of the times, never hesitate to seize the opportunities, meet the challenges, so that they can achieve greater cause with the help of the times. If farmers want to

change their own destiny, they first need to change their consciousness and move against the times, so that they can obtain greater living space and development space.

2.2. Improving One's Own Scientific and Cultural Qualities

Science and technology is the first productive force, if farmers have a wealth of scientific and cultural knowledge, will certainly be helped by knowledge more clear self-development direction, more know how to learn from each other, more know how to avoid risks, more know how to accelerate production. Knowledge is power, and many farmers feel infinitely confused and puzzled about how to change their conscious destiny, because they do not have rich knowledge and culture, let alone know how to integrate knowledge and culture into their own life, so that the self with the help of knowledge to change their destiny, which is regrettable[3]In order to enrich themselves, farmers can learn the relevant knowledge about the processing industry and the marketing industry seriously. When they complete the six industrial developments, they can find concrete ways to exist and improve, so that the scientific and cultural knowledge can be used accordingly. Farmers should make the great strategic thought get the assistance and support of concrete science and culture, so that the great strategic thought surging up strong vitality.

2.3. Active Transformation of Production Patterns

The purpose of thought is to guide behavior, if one only has great ideas but does not engage in lofty work at all, then great ideas will have no meaning. After changing ideas and learning scientific and cultural knowledge, the next step is to change the mode of production. Only by transforming the first industry known to them into six industrial developments can farmers increase production and income, their days be better, and farmers contribute their own strength to the work of rural revitalization. Farmers should first develop the secondary industry well and process their own agricultural products accordingly, so that agricultural products can achieve greater sales value. Secondly, they should develop the tertiary industry properly according to their own ability. If they can develop the tertiary industry well, they will inevitably make their own agricultural products face a larger stage, and they will certainly increase their income exponentially. What is more affordable for farmers than increasing their incomes? If farmers want to get benefits, they should also carry out the relevant production work seriously under the condition of keeping a cool head.

2.4. Coordinated Development of the Three Major Industries

In carrying out the work of six industrial development, farmers should understand that the three industries should be developed in a coordinated manner, and only by developing the three industries in a coordinated manner can they make their own six industrial development achieve real vitality. At the same time, only by coordinating the development of the six industries can farmers have a more rational production system, so that the whole village can get more room for development, so that the rural labor force can get a greater stage of display, and can make more people feel the gospel. Farmers should not be eager to achieve quick results, eager to achieve, should make the three industries to perform their respective duties, solid foundation, improve processing rate, and products can be sold space. After many farmers know the vital importance of the tertiary industry, they rush to develop the tertiary industry without any preparation, and the result can only reap an unsatisfactory result. While the tertiary industry is important, it is also dangerous to develop the tertiary industry in a rush, regardless of structure. Therefore, all Chinese farmers should make great efforts to understand how to develop agriculture, how to develop industry, how to carry out service industry, and how to complete good industrial integration.

3. Conclusion

If the Chinese nation wants to achieve a great rejuvenation, it cannot be separated from the help of the peasants. If the peasants can not change their consciousness, raise their consciousness, make clear the truth, and work hard, it will inevitably be difficult to occupy a more favorable position in the development of the times, which is obviously regrettable. The strategy of rural revitalization

requires the integration of industries, which should cooperate and cooperate with each other, so that the industry and industry can achieve mutually beneficial effects, and the farmers' income can be greatly improved, so that farmers can see a wider world, which is of great significance to the development of rural areas and farmers' development.
