Keywords: Niche Perspective, Village Pension Value, Evaluation System

Abstract: From the perspective of niche, the establishment of the evaluation system of the value of village endowment needs to be combined with the analysis of the actual development of each region. The establishment of the evaluation system should not only meet the development needs of each region, but also be scientific and reasonable. The comprehensive implementation of the evaluation system, the implementation of the work environment, increase the supervision of the elderly care of villages in various regions, play a good role in promoting the economic development of various regions. In order to continuously improve the value evaluation system of village pension, it needs to be analyzed from many angles and all aspects, so as to lay a good foundation for the development of village pension industry in various regions.

1. Introduction

With the continuous development of modern society, the government and relevant departments of our country pay more attention to the pension of rural population. According to the detailed analysis of the pension problem in rural areas, we have developed a perfect evaluation system, which not only solves the pension problem in rural areas, but also promotes the stable development of each area. Moreover, the pension problem in rural areas will be an important task for the development of modern society. In combination with the development of pension in various regions, a perfect evaluation system will be formulated. Through the implementation of the evaluation system, it will be continuously improved to solve the pension problem in various regions scientifically. However, in various regions, there will be pension industry to enhance the economy, and to expand its development scale constantly, which not only has no positive impact on the village pension industry, but also has an impact on the excessive occupation of village resources, and the development of the village pension.

2. Village Endowment Ecosystem From the Perspective of Niche

From the perspective of niche, the village elderly care ecosystem is mainly composed of the internal ecological chain and external environment of the elderly care industry. Each internal part has its own significance and value. Only when the specific results and contents of its composition are clear, can it play an important role in various functions [1]. In particular, the establishment of the value system of village pension in each region should not only take into account the actual development of each region, but also improve the economic level of each region. To make clear the functions and make them play an important role in the ecological position, and the relationship between the functions is not only independent, but also mutual. Only when the functions gradually cooperate closely, can we ensure the stable development of the village pension ecosystem.

From the perspective of the value of village pension, considering the specific characteristics and nature of the industry ecological chain, analyzing it from different perspectives can find the problems existing in the village pension in time, analyze them pertinently, take scientific and reasonable solutions, analyze them from a new perspective, innovate a variety of pension models, and develop a good for the development of village pension According to its own development needs,

we should strengthen the implementation of the development strategy, integrate the development resources, and provide favorable conditions for the development of village pension. The problem of providing for the aged in rural areas will be an important task for the development of modern society. In combination with the development of providing for the aged in various regions, a perfect evaluation system will be formulated. Through the implementation of the evaluation system, it will be continuously improved to solve the problem of providing for the aged in various regions. However, in various regions, there will be pension industry to enhance the economy, and to expand its development scale constantly, which not only has no positive impact on the village pension industry, but also has an impact on the excessive occupation of village resources, and the development of the village pension.

In recent years, with the continuous development of China's economy and society, China has increased the development of the elderly care industry, focusing on the upstream ecological development demand, developing more development functions, enriching the content of village elderly care, and providing basic conditions for the establishment of its value system.

Then from the perspective of upstream industry demand development function, it mainly shows three aspects. The first is resources; the second is facilities; the third is living life. It needs to be comprehensively analyzed from all aspects to ensure that each requirement can be more than 50% functional. From the perspective of niche, its functions and contents are relatively rich. Whether it is medical resources, environmental quality, or even traffic location, etc., it will play a good role in promoting the innovation of the model of the village pension industry.

3. Analysis on the Value Evaluation System of Village Endowment From the Perspective of Niche

3.1. Evaluation Dimension

Considering the relationship between village pension and niche, as well as their own characteristics, this paper makes a scientific and reasonable analysis to ensure that the village pension value system can have a positive impact on its stable development, make it have a perfect ecological chain, make clear the location of each ecological chain, and make all kinds of functions give full play to their important role and value. At the very least, it can provide a satisfying foundation for the sustainable development of time level. Then the overall planning and development should also be considered for the layout of the time layer. In addition, from the perspective of functional layer, it has significant uniqueness and diversification [3]. Therefore, the establishment of the value evaluation system should be combined with the comprehensive analysis of the development factors of each region and the nature of village endowment, constantly enrich its development resources, and lay a good foundation for promoting the friendly development of modern ecology in China.

In view of the development of the village pension industry in the Pearl River Delta, the relevant

departments have carried out the corresponding investigation. Through the analysis of the investigation results, the factors affecting the development of the village pension value in the Pearl River Delta mainly include five aspects. First, government agencies, involving more departments and personnel; second, industry directors, usually including Civil Affairs Bureau, Aging Committee, etc. Third, industry supervision. It will involve Aging Industry Association, pension service association, etc. Fourth, personnel training. It is not only to cultivate the professional ability of relevant staff, but also to improve the work awareness of relevant staff. Fifth, it is the industry support institutions, including the transportation department, infrastructure department, medical service department, etc.

Figure 2 Map

3.2. Value Subsystem, Evaluation Module and Index Variable

There are three aspects of the village pension value, which are width, overlap and density. The establishment of the village pension value system needs to be considered and analyzed from these three perspectives, from different stages of its analysis, so that it can show a variety of characteristics, taking into account the economic development of each region and the development of the pension industry, so as to carry out corresponding supervision. So in the development of the pension industry in various regions, it is inevitable that the transitional development of the pension industry will not only affect its sustainable development, but also lose the value and significance of the development of the pension industry. In this regard, it is also necessary for relevant departments to increase their supervision and innovate diversified development models. In the development of each region, the application of different models can meet the development needs of the pension industry in each region [4].

From the perspective of niche, its development width is becoming wider and wider, but its overlap is becoming smaller and smaller, and its density is increasing. Only by developing in this form can the value of village pension be brought into full play, and the survival ability of pension industry be enhanced, which will not be affected by various factors. Based on the principle of long-term development, the analysis of various factors is carried out. It can find the problems and deficiencies in time, and take scientific measures to solve them, so as to create a good environment and conditions for the stable development of the village pension industry. From the perspective of niche, its functions and contents are relatively rich. Whether it is medical resources, environmental quality, or even traffic location, etc., it will play a good role in promoting the innovation of the model of the village pension industry.

Taking the Pearl River Delta as an example, from the perspective of medical resource module, we need to improve the infrastructure, whether it is the introduction of hardware facilities, or the configuration of related equipment, etc., which will have different degrees of impact on the development of the village pension industry [5]. In addition, it also includes all kinds of staff, combined with the specific work content and responsibilities, to allocate the staff reasonably, so that

the staff can give full play to their own advantages in the appropriate post work, so as to improve the efficiency and quality of the village pension industry, and play a good role in promoting.

Figure 3 Map

With the continuous development of the village pension industry, it has expanded its development scope and innovated more functions for its internal development, including medical resources, service facilities, healthy diet, infrastructure and other functional modules [6]. For example, taking the Pearl River Delta as an example, the infrastructure of the village pension industry is perfect, which can meet the development needs of the village pension industry. Then, taking the niche width as the starting point, the paper analyzes the internal facilities, personnel, development areas, etc., and divides a number of planning contents from the overall layout to ensure the density of the village pension space. Combined with the analysis of the quantity and quality of the facilities in the current village pension industry, the development of each work and function needs to be supported by a perfect system, and the construction of infrastructure needs to be strengthened. Its purpose is also to meet the pension needs of the elderly, so that the value of the village pension continues to improve. Similarly, it has the same specific and important impact on the development of China's modern society.

4. Conclusion

In the development of modern society, in order to promote the stable development of the village pension industry, it is also necessary to combine its own comprehensive analysis of development, based on the perspective of niche theory, improve each system and function, increase the establishment of the village pension value evaluation system, and fully implement and implement it in all work links to ensure the scientific work links. It has a clear development goal, which makes the value of the old-age care of the village continuously improve. Similarly, it has the same specific and important influence on the development of the modern society of our country. It enriches the development resources of the old-age care of the village, establishes the subsystem, and creates a diversified development mode for the development of the old-age care of the village, so as to promote the all-round development of all fields in our country.
