Keywords: Scientific Development View, Ecological Civilization, Construction Path

Abstract: Whether ecological civilization can be sustainable development will be related to the survival and development of human beings. And the theory of scientific development view can adhere to the essence and core value of socialism, and can embody the characteristics and national color of China, and make the theory of socialism with Chinese characteristics more scientific and systematic. It is suggested that the construction of ecological civilization is a kind of innovation of scientific development view in theory, and we should be able to build material civilization, spiritual civilization and ecological civilization together under the guidance of scientific development view, so that the great rejuvenation of the Chinese nation can be realized. This paper briefly discusses the path of ecological civilization construction in China from the perspective of scientific development.

1. Introduction

The scientific concept of development requires us to adhere to the people-oriented, comprehensive coordination and sustainable, which is an important thought guided by the theory of "three represents" and Deng Xiaoping, and is a major strategic thought that has been put forward in the early stage of the development of our country in the new century, which accords with the reality of our country in the process of career development. The scientific development view is able to help the construction of ecological civilization in our country to a better road, so we should be able to attach importance to the scientific development view, for the construction of ecological civilization of great significance, and unswervingly establish and implement the scientific development view, so as to better promote the construction and further development of ecological civilization in our country. Nowadays, the research problem is how to establish the ecological civilization of our country under the guidance of the scientific development view.

2. The Present Situation of Exploring the Path of Ecological Civilization

In our country must first be able to find the logical starting point of exploring the path is ecological civilization, and there are several representative viewpoints in the academic circles, first of all, the big ecological civilization, including nature, spirit and society, which should be able to play a role through the overall coordination. Secondly, ecological civilization is also an important part of modern civilization system, which belongs to a new stage of civilization form. Then the ecological civilization should be able to integrate the small civilization and the big civilization, to form a higher level of civilization form on the basis of the developed existing civilization, and then to form a more advanced productive force on the basis of the existing productive forces, and finally to be able to respect the wealth acquired under the objective law. In the report of the 17th National Congress of the Communist Party of China, we also put forward how to build ecological civilization. In 2008, President Hu Jintao stressed the importance of ecological civilization as one of the overall layout. This means that the construction of ecological civilization is an ideal realm, but also a realistic goal, so the process of realizing it is a long-term vivid practice. Under the guidance of the scientific development concept theory, first of all, we should be able to enable all people to establish the consciousness of ecological civilization, secondly, we should be able to change the way of economic development, and construct the effective rule of virtue and rule of law system to carry out the construction of ecological civilization. Then we should be able to regulate all the

functions of the government and make the governance structure more perfect, which can make the management of the ecological environment more effective. Finally, we should be able to promote the overall layout of the "five-in-one" through the circular economy, so as to build a more perfect ecological security system, and seek international cooperation on this basis to solve global resource and environmental problems through consultation[1]

3. Scientific Development Concept Can Promote the Construction of Ecological Civilization

In the 20th century, the environmental and ecological crisis has become one of the global problems. At that time, there were eight famous environmental pollution incidents, which caused widespread concern and great environmental protection activities, which meant that the civilization of industry had come to an end. In order for mankind to develop sustainably, it was necessary to choose a more advanced civilization to replace the traditional backward industrial civilization, which is the construction of ecological civilization. The so-called ecological civilization means that people are transforming the objective material world through their own efforts, and at the same time can constantly overcome the various negative effects in the process of transformation, through some effective measures to actively improve. To make the relationship between man and man and nature more harmonious, to establish a more orderly ecological operation mechanism.

The construction of ecological civilization is an inevitable trend, because it is a consequence of people's reflection on the crisis of industrial civilization, so the construction of ecological civilization is a kind of change and transcendence, and guided by the scientific development view, we can adhere to people-oriented, and make the traditional material-oriented and traditional civilization with economic growth as the ultimate goal more advanced. First of all, the ecological civilization and the scientific concept of development are very consistent inside, because their starting point is the same, they are all to respect and protect the ecological environment, so in the process of economic development, we should be able to enable all people to establish a sense of protection of the ecological environment, so as to create a better living environment for them. Secondly, the strength that they rely on is the same, and they all rely on the strength of the masses. Then their path of development is the same, emphasizing the need to follow the path of sustainable development, because it is the inevitable trend of the times in the process of development, in order to make people and people, man and nature, man and society become more harmonious, we must completely abandon those models of economic development only for the consumption of resources, and take the path of sustainable development. Finally, their ultimate concern is the same, they will take the survival and development of human beings as the ultimate care object. The ecological civilization belongs to the social civilization of ecologicalization, whether it is the idea or the social form, it is of great significance to the implementation of the scientific development view, so if we want to make man's nature and society more harmonious, we must let the scientific development view as the guiding ideology.

The Scientific Outlook on Development and the Construction of Ecological Civilization in China
1. The urgency of ecological civilization construction
2. The connotation of ecological civilization construction
3. Building an "environmentally friendly society"

4. Under the Guidance of the Scientific Concept of Development

It is a reflection to promote the construction of ecological civilization in China, reflect on the various environmental problems and crises brought by the industrial civilization, and know that there are cultural, political and economic roots from the root of the global problems, so if we want

to further develop the ecological civilization, we must take the scientific concept of development as the guiding ideology[2].

Figure 1 Ecological civilization

Establishment of ecological values

The values which our country has followed in the course of its past development are very traditional, they are all people-centered, which holds that man is the main body of the center of the universe, only talent has value, and all other life and all the matter of nature have no value, so it is this wrong value that makes industrial civilization become more and more anti-natural and anti-ecological in the process of development, which means that we must establish the ecological value of harmonious development of man and nature. This ecological value emphasizes that not only man is the subject, but also nature is the subject, and nature also has the same value as man. Because the origin of all life on the earth depends on nature, and human beings are only ordinary members of nature, so human beings must respect nature and live in harmony with nature in the process of economic development. When the whole society can set up such ecological values, then it can be realized, and the ultimate goal is to develop and progress harmoniously between man, nature and society. If we want to establish ecological values, we must first be able to carry out extensive publicity and education, so that all people can pursue this kind of values and ideas, and enhance the consciousness of all people in society to take good care of nature and protect the environment. Secondly, we should be able to take the scientific development concept as the guiding ideology to carry out all the work, after all, the society should be able to improve the ecological environment while developing, so as to set up better indicators and provide a better basis for the establishment of ecological values. Finally, we should be able to change their thinking from environmental legislation to ecology, and strengthen their concept of environmental protection. Therefore, the state and local legislatures should be able to turn, let the ecological protection of this work reflected in all aspects, strengthen the enforcement of the law, to be able to do the law must be prosecuted, law enforcement must be strict.

Table 2 Specific content of the five-in-one

Five in one	
1. Economic construction	4. Social construction
2. Cultural development	5. Construction of ecological civilization
3. Political construction	

The concept of eco-political development originated in the 1960s as a result of reflection on global crises and the further survival of mankind. The so-called ecological politics is to be able to deal with the relationship between environment and politics through research. Ecological politics is different from previous politics and belongs to a new kind of politics, which can be based on sustainable society, nature and economy. First of all, we should be able to strengthen the ecological responsibility of the government, so that they can better carry out the construction of ecological environmental protection system. Because the government is the core subject of public administration after all, it will have a very strong guiding effect on the development of the whole society, so the government should be able to set up a more scientific concept of development, carry

out green administration, and take the initiative to take the responsibility of protecting the ecological environment. Secondly, we should be able to promote the public to participate in the construction of ecological politics in an orderly manner, after all, it is very closely related to people's interests, so we must have the participation of the broad masses of the people. Therefore, on this basis, to be able to enhance communication with the public, using a variety of channels and ways to continue to absorb the advice they give. It can also improve the management of eco-environmental organizations to improve their political participation. The media should also be able to shoulder their responsibilities, tell the truth to the public, and play a strong role in guiding and supervising public opinion. Finally, we should be able to work with environmental organizations in other countries, because environmental issues are becoming more globalized, so we should be able to work together to manage environmental issues through cooperation, so that we can better achieve sustainable development[3].

5. Conclusion

Through the analysis of the full text, we can know that the construction of ecological civilization is to fear nature, so that human beings can live in harmony with nature and society, and to protect ecological civilization while developing economy. The concrete exploration path should proceed from the scientific development view itself and the political aspect.
